

Science Inquiry Skills

Questioning and Predicting

Based on my science understanding, what do I predict will happen?

What question will I investigate?

What are other ways I could share my findings?

How do I communicate this with a graphic representation (labelled diagram, table, graph)?

Communicating

How clearly have I communicated my method and findings?

How could I improve the fairness of my method?

Processing and Analysing Data and Information

What did I think was going to happen?

How can I represent my data?

Planning and Conducting

How can I investigate this cause and effect relationship?

How will I accurately measure my observations?

How do I accurately use this equipment?

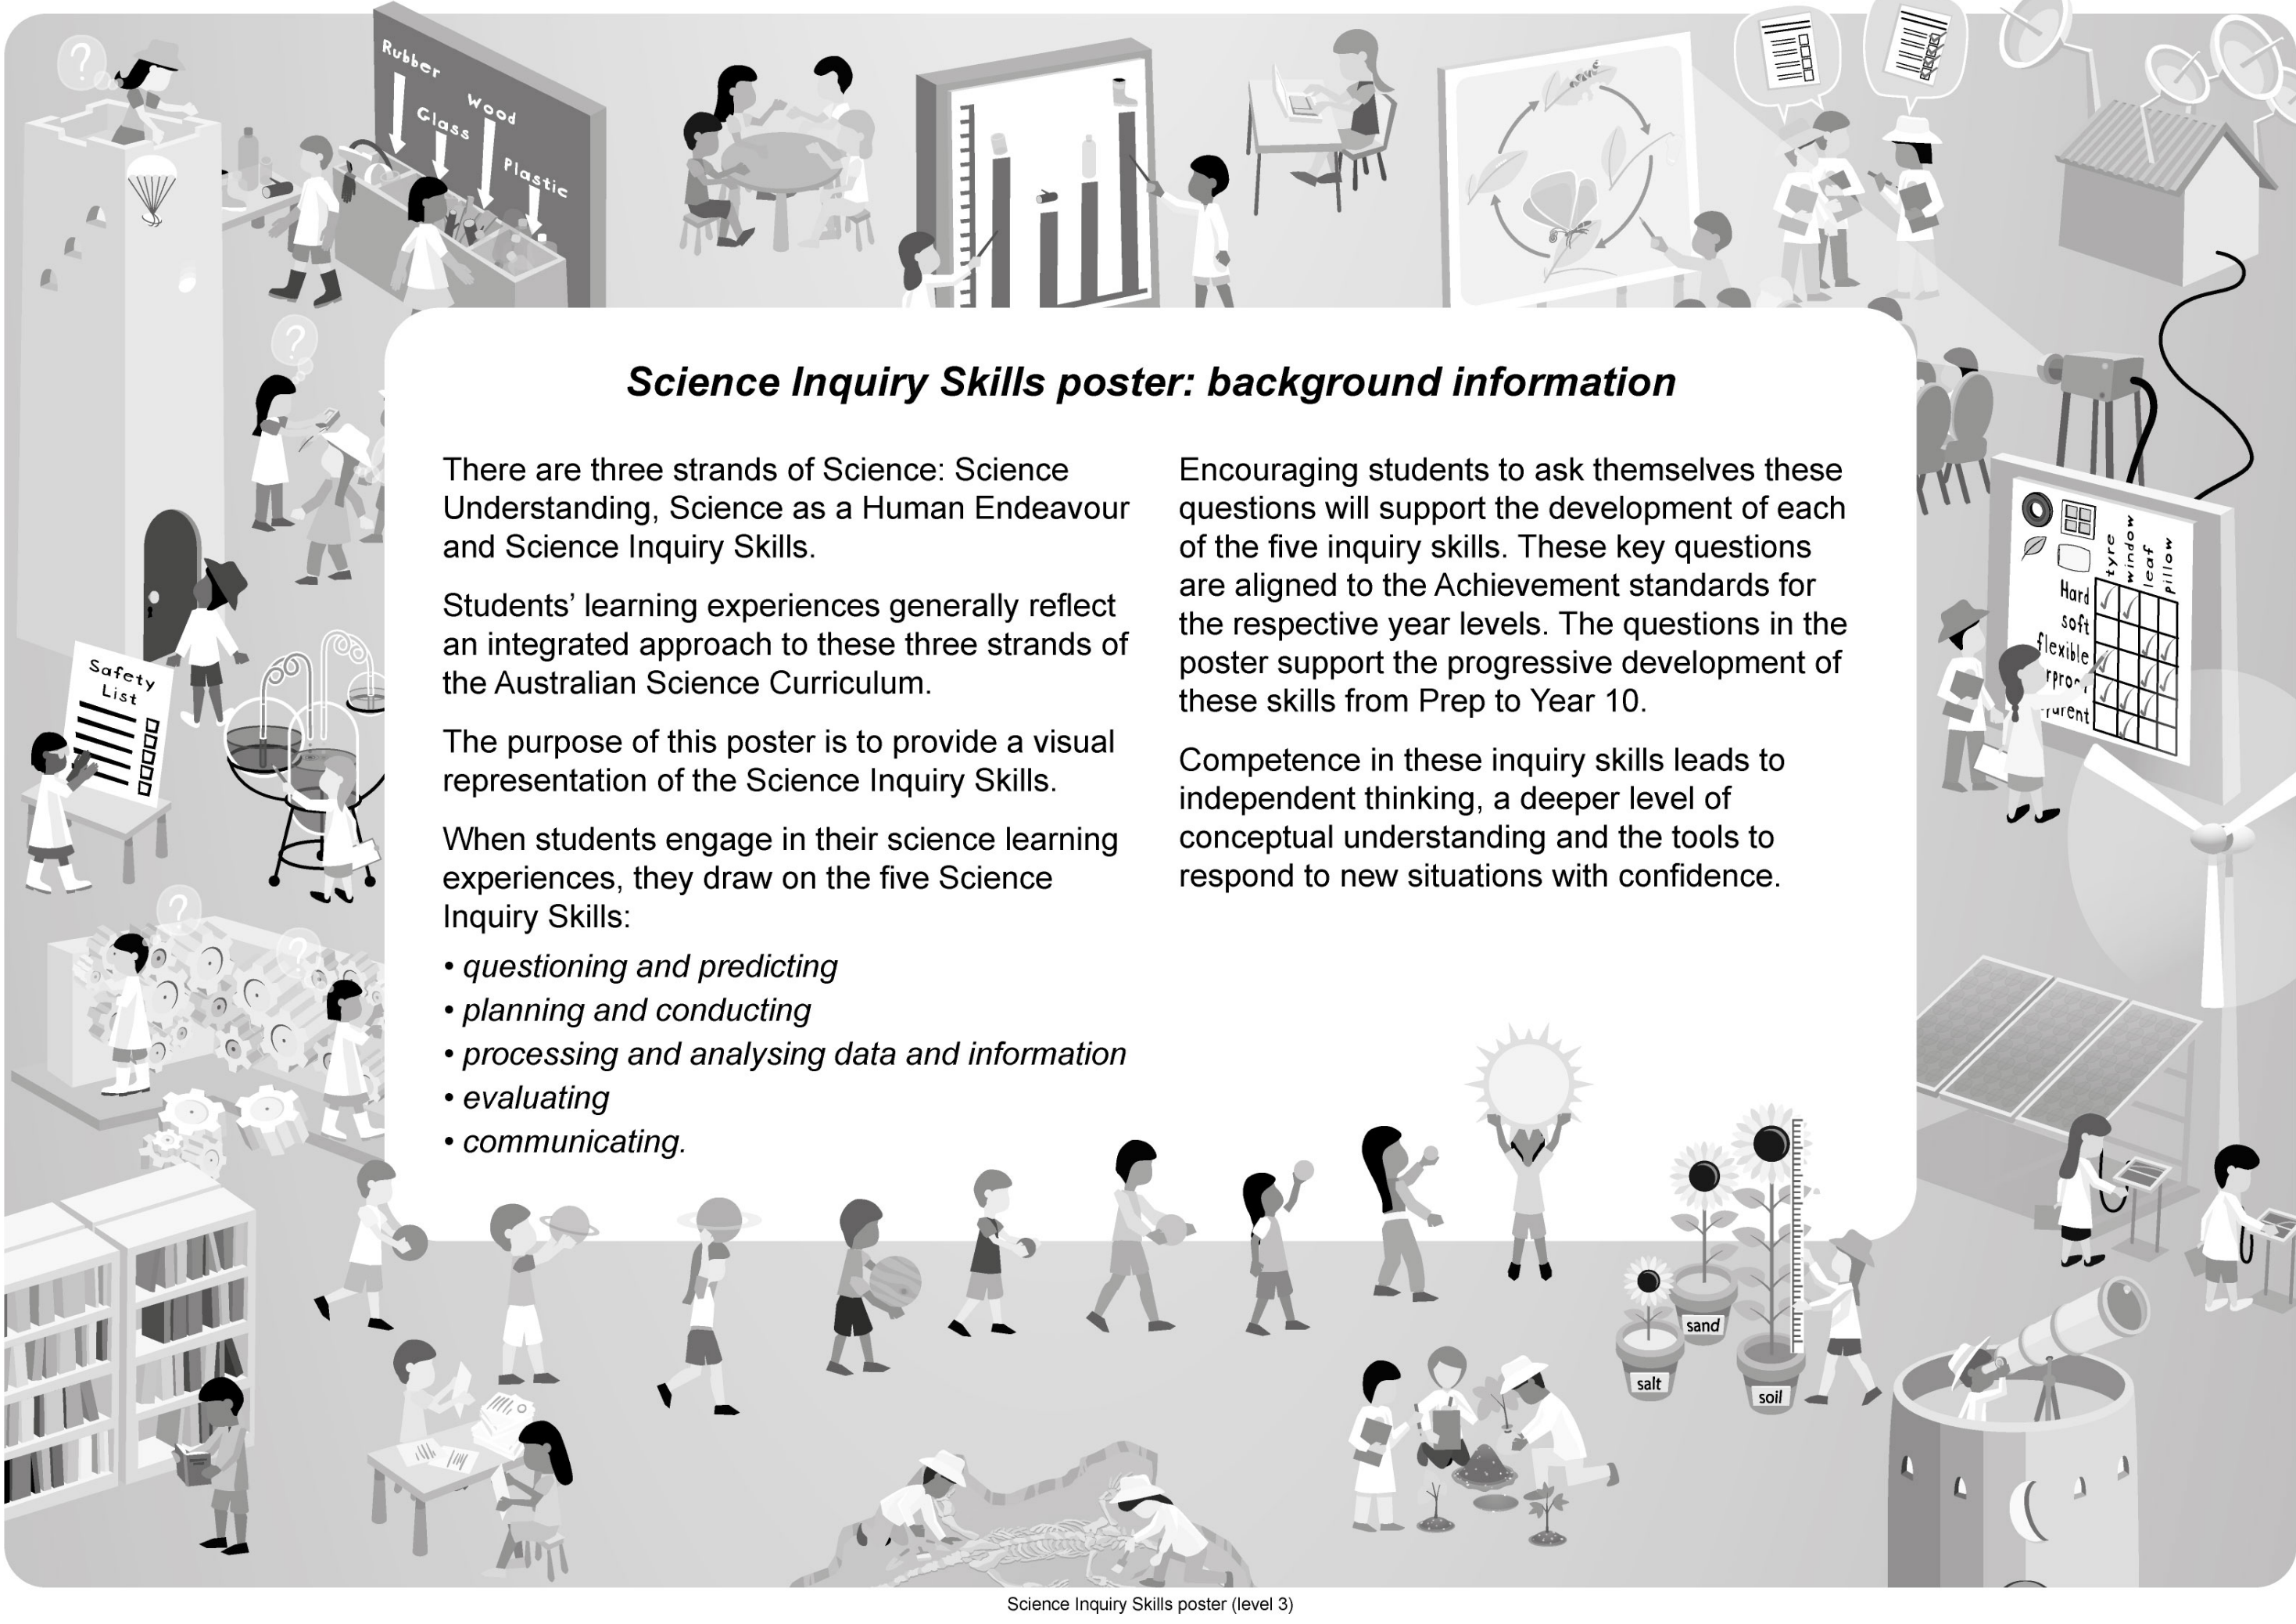

What variables will I change, measure and keep the same?

Was this test fair? Why?

Was my method fair? Why?

How could I change the method to improve the quality of my data?

Evaluating

Science Inquiry Skills poster: background information

There are three strands of Science: Science Understanding, Science as a Human Endeavour and Science Inquiry Skills.

Students' learning experiences generally reflect an integrated approach to these three strands of the Australian Science Curriculum.

The purpose of this poster is to provide a visual representation of the Science Inquiry Skills.

When students engage in their science learning experiences, they draw on the five Science Inquiry Skills:

- *questioning and predicting*
- *planning and conducting*
- *processing and analysing data and information*
- *evaluating*
- *communicating.*

Encouraging students to ask themselves these questions will support the development of each of the five inquiry skills. These key questions are aligned to the Achievement standards for the respective year levels. The questions in the poster support the progressive development of these skills from Prep to Year 10.

Competence in these inquiry skills leads to independent thinking, a deeper level of conceptual understanding and the tools to respond to new situations with confidence.
