

1. As soon as she saw the horse's leg, Drew knew she would be finishing her Journey on foot. Why would Drew have to finish the journey on foot?

2. Within a few days the army had surrounded the city, halting all movement in and out, and the people of Paris soon began to starve. Why did the people begin to starve?

3. Tony looked in the bucket and put down his brush knowing that he couldn't finish the job. Why couldn't Tony finish the job?

### SIGNS

The first sign was the increased movement in the treetops. Then she heard a humming in the overhead power cables. But it was the sudden drop in temperature which sent her rushing to the line. Dropping pegs in her haste she quickly gathered all she could carry before returning indoors.

- a. What was about to happen?
- b. What did she carry inside?
- c. Where was she at the beginning?

### THE TROPHY

"Wow! What a great trophy. What did you get that for?" I asked Tim.  
"Oh, it's not mine exactly," Tim replied modestly. "It's Sandy's and mine really. We won the jumping events. She only knocked down two railings and she was the only one to clear the water jump. I nearly came off - just managed to stay on."

- a. What is Sandy?
- b. What was the trophy for?

### VAMPIRE BATS

Bats are different to all other mammals in that they have developed the ability to fly.

Unlike most bats, vampire bats do not eat insects. Sleeping birds, sheep and even cattle provide the vampire bats with their main food - blood. The size of the tube from the vampire bat's throat to its stomach means that it can only swallow liquids. Their best source of liquid food is blood.

These bats are only about eight centimetres long. Their two front teeth are so sharp and their bite is so quick theft often their victims do not even notice that they have been bitten. The word vampire was originally a name for the mythical human vampires of legend and movies. Like them, vampire bats usually go for the large vein in the neck, lapping up their liquid meal.

Although humans are not often bitten, people living in the rain forests of Central and South America usually sleep under nets to keep away insects as well as vampire bats.

Because they attack so many different types of disease-carrying animals, the vampire bat's bite can be dangerous.

- a. Are vampire bats mammals? How do you know that?
- b. What do most bats eat?
- c. Is the vampire bat's bite painful? How do you know that?
- d. Why were these creatures given the name vampire bats?
- e. How do vampire bats get blood into their bodies?
